

to the US-89/91 Logan to North Logan Corridor Study Public Open House

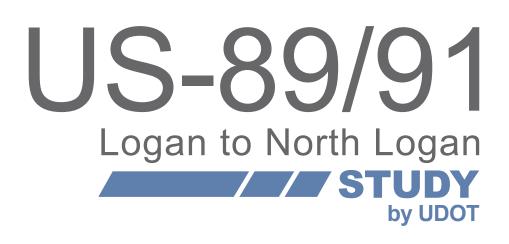

Keeping Utah Moving

STUDY PURPOSE

The Utah Department of Transportation (UDOT), in cooperation with local municipalities in Cache County, conducted a study of transportation needs along US-89 and US-91 and in the surrounding area with the intent to improve mobility on Main Street.

After reviewing numerous studies from the past 20 years, UDOT determined that a single solution on Main Street is not sufficient to meet future needs. Multiple projects on and off the corridor are needed to address transportation demand into the future and improve mobility for local and regional transportation users.

This approach provides resiliency to the transportation system throughout the county by adding redundancy into the network and identifying new local and regional connections.

HISTORY

Previous studies and plans reviewed include:

- Cache Metropolitan Planning Organization (CMPO) 2050 Plan, Highway & Active Transportation Projects (Ongoing)
- South Cache Corridor Study (2023)
- Logan Main Street Corridor Study (2022)

STUDY GOALS

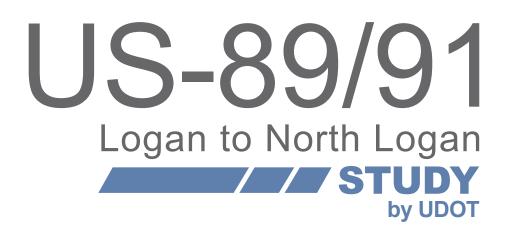

Improve mobility for all people using Main Street.

- Improve network functionality and resiliency for people traveling to and through the corridor from communities north and south.
- Identify alternate north-south corridors to serve regional travel. Improve safety for all people.
- Encourage freight traffic to use alternate corridors instead of Main Street.

Make downtown Logan (between 100 South and 400 North) safer and more comfortable for people walking, biking, and supporting local businesses or engaging in community activities.

- Increase physical space available for people to walk, bike, or participate in civic life.
- Reduce vehicle speeds in downtown Logan.
- Increase green space, street trees, or other measures to improve comfort and placemaking in downtown Logan.

SOLUTION DEVELOPMENT

STAKEHOLDER ENGAGEMENT

SCENARIO DEVELOPMENT

PHASE 1 – **EVALUATION**

PHASE 2 – **EVALUATION** Stakeholders, agencies, special interest groups, and residents were engaged throughout the process through three committees:

Participants provided insight into local needs, participated in workshops, and gave input as solutions were developed. Input was also solicited from Cache County residents through a survey. Over 600 residents completed the survey, from which important insights arose regarding traffic challenges and priorities.

Using quantitative transportation, growth, and land use data paired with qualitative input from stakeholders, seven scenarios, each consisting of a set of projects, were developed to address transportation needs. Each scenario considered new facilities, operational improvements to existing facilities, improved connections, and multimodal needs.

- North/South Alternative Corridors Minor North/South Alternative Corridors – Major • Widen and Reroute US-89 to 1000 West Eastern Arterial

Each scenario went through a preliminary evaluation to determine its ability to meet current and future transportation needs. This process narrowed the list to a refined set of scenarios from the high-performing projects. These refined scenarios were named:

- Parallel Corridors • 1000 West Focus Main Street Focus

The three new scenarios were evaluated in more detail on their compatibility with regional multimodal planning, neighborhood impacts, and ability to manage systemwide travel delays.

This process identified the recommended scenario: Parallel Corridors.

EVALUATION PROCESS

Metrics were developed to measure how effective the preliminary scenario projects were in meeting the study goals. The following table summarizes these metrics.

METRIC	METRIC EXPLANATION	
Number of east-west routes with improved access to and across Main Street within the study area	Excessive east-west delays at major intersections were a common concern expressed to the study team during outreach and stakeholder interviews. By prioritizing a limited number of east-west routes, Main Street becomes less of a barrier, and access to alternate north-south facilities is increased.	Improv
Number of north-south continuous routes within the study area	Providing designated north-south alternatives to Main Street can reduce congestion and mitigate impacts from current use of neighborhood back routes by directing north-south traffic to appropriate alternate routes.	Improv
Change in travel time and volumes (including freight volumes) on Main Street and parallel routes	Direct measure of whether Main Street operations are improved by scenarios solutions. Target is meeting north-south travel demand while keeping Main Street and other priority facilities functioning at acceptable levels. Measured using travel demand model.	Improv Make o people or eng
Planning-level feasibility	High-level evaluation of obstacles to scenario implementation (community impacts, contractibility, concerns, etc.).	Improv Make o people or eng

Not Advanced Not Advanced Main Street Focus Incorporated into Parallel Corridors and 1000 West Focus

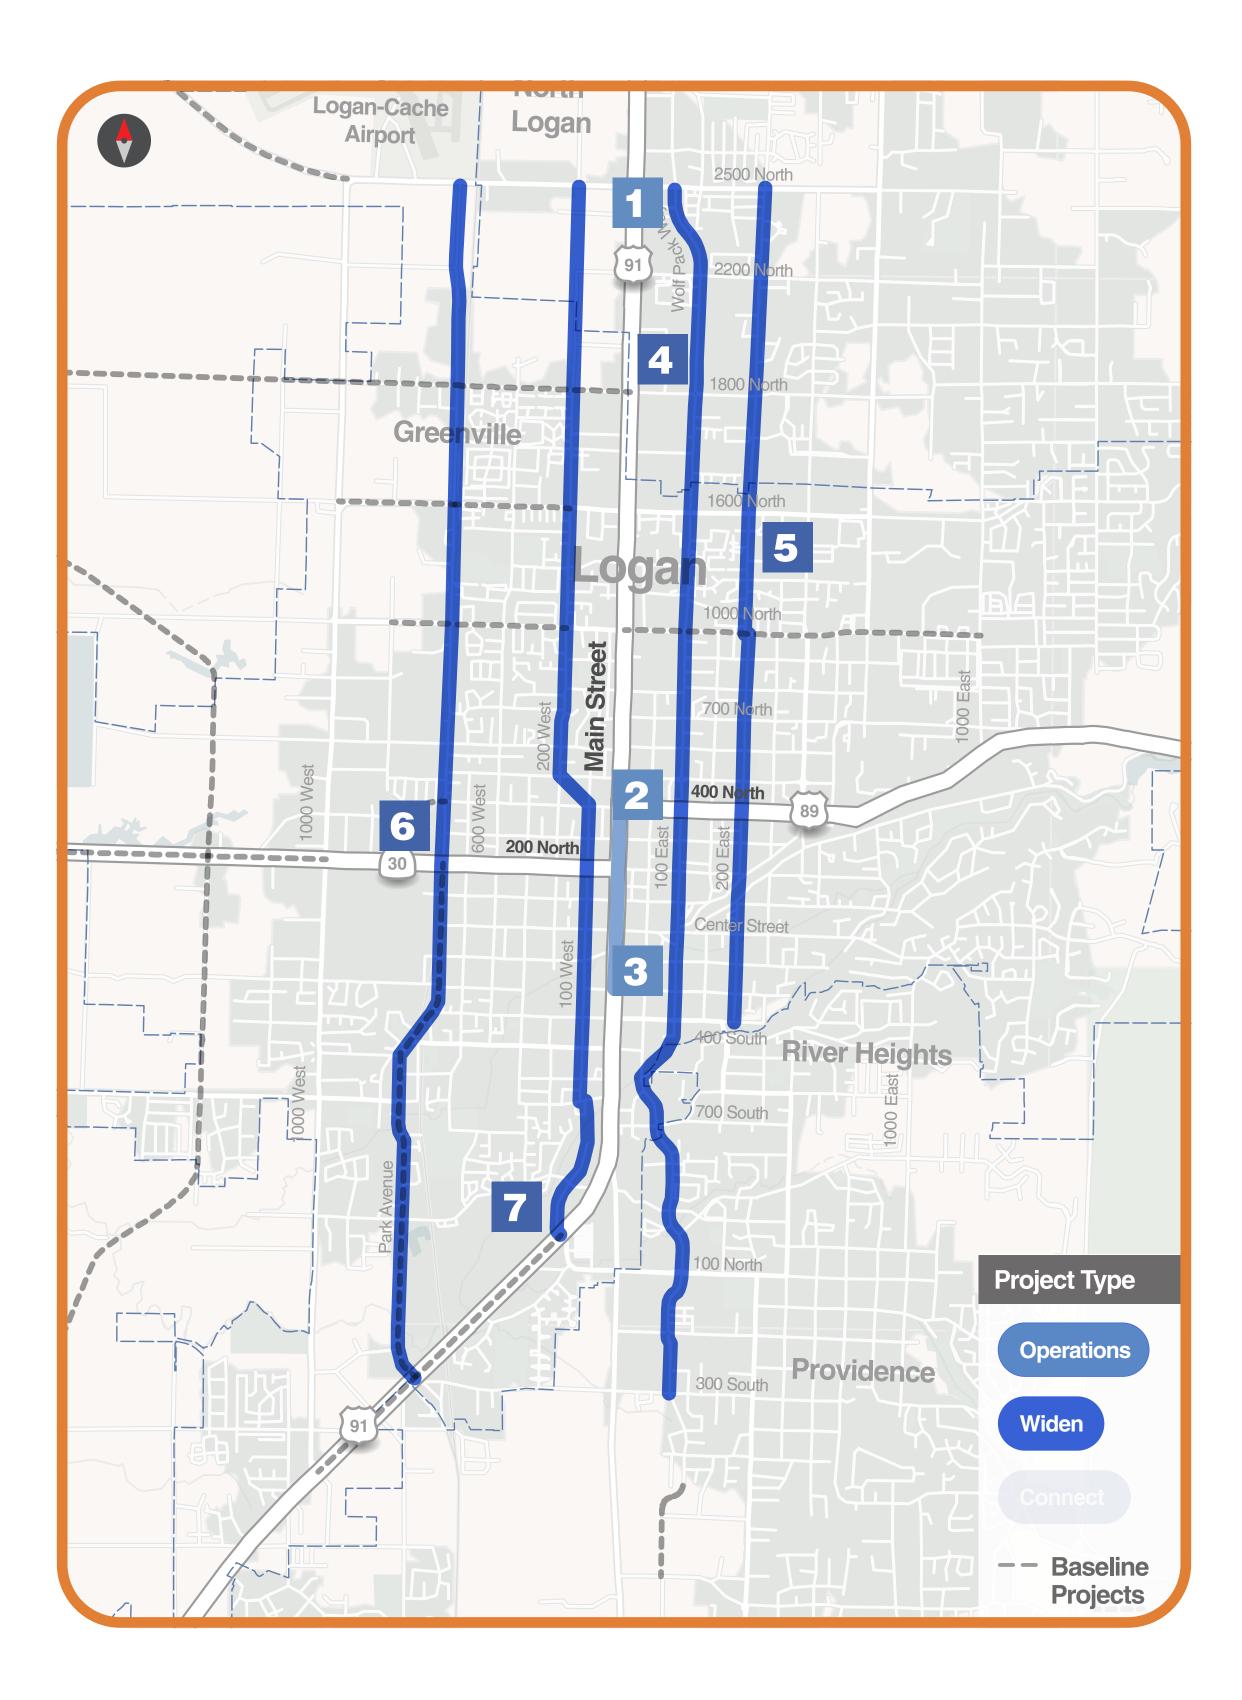

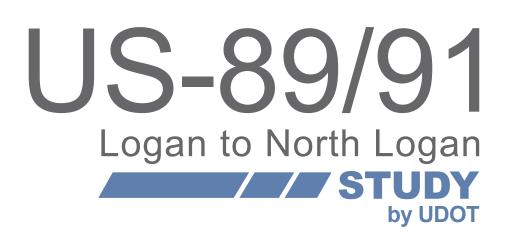

PARALLEL CORRIDORS SCENARIO

The Parallel Corridors Scenario focused on operational improvements and widening projects along north-south corridors within the study area.

1	

- **200 East:** Operational improvements
- **Main Street:** Raised medians on Main Street through downtown Logan
- Main Street: Limited on-street parking and improved pedestrian environment
- **200 East:** Widen to five lanes
- **400 East/600 East:** Widen to five lanes; improve dugways
- 600 West: Widen to five lanes
- **100 West:** Widen to five lanes; connect 100 West to 200 West north of 400 North

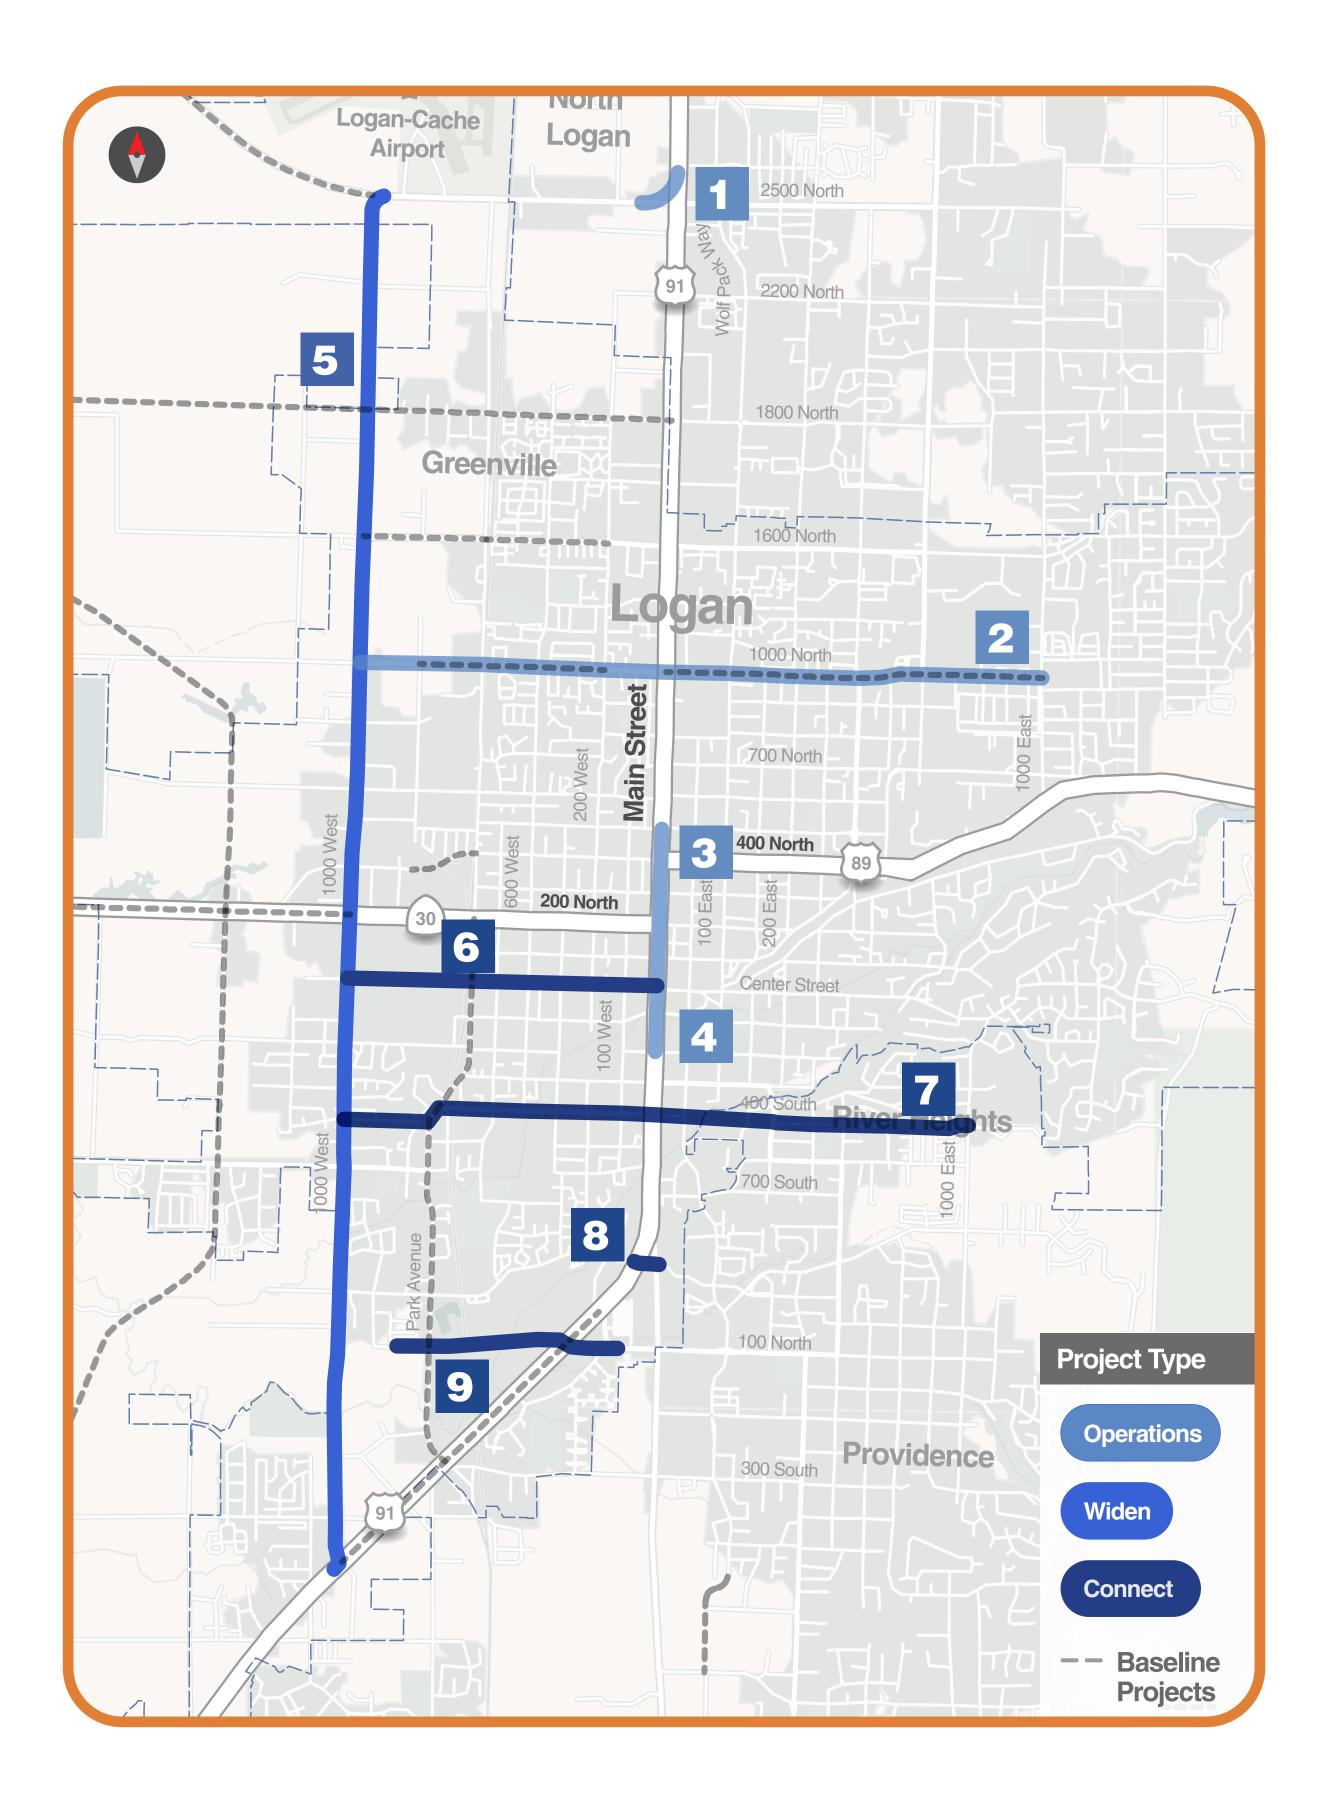

1000 WEST FOCUS SCENARIO

The 1000 West Focus Scenario focused on operational improvements and connection and widening projects throughout the study area, prioritizing east-west corridors.

- **200 East:** Operational improvements
- **1000 North: Operational improvements**
- Main Street: Raised medians on Main Street through downtown Logan
- Main Street: Limited on-street parking and improved pedestrian environment
- 1000 West: Reroute US-89/US-91 to 1000 West and widen to seven lanes
- **Center Street:** Connect Center Street from 100 South or 200 South to 1000 West
- 400 South: Connect 400 South from 1000 West to 1000 East
- Golf Course Road: Connect Golf Course Road from US-89/US-91 to SR-165
- **1200 South:** Connect 1200 South through to 1000 West

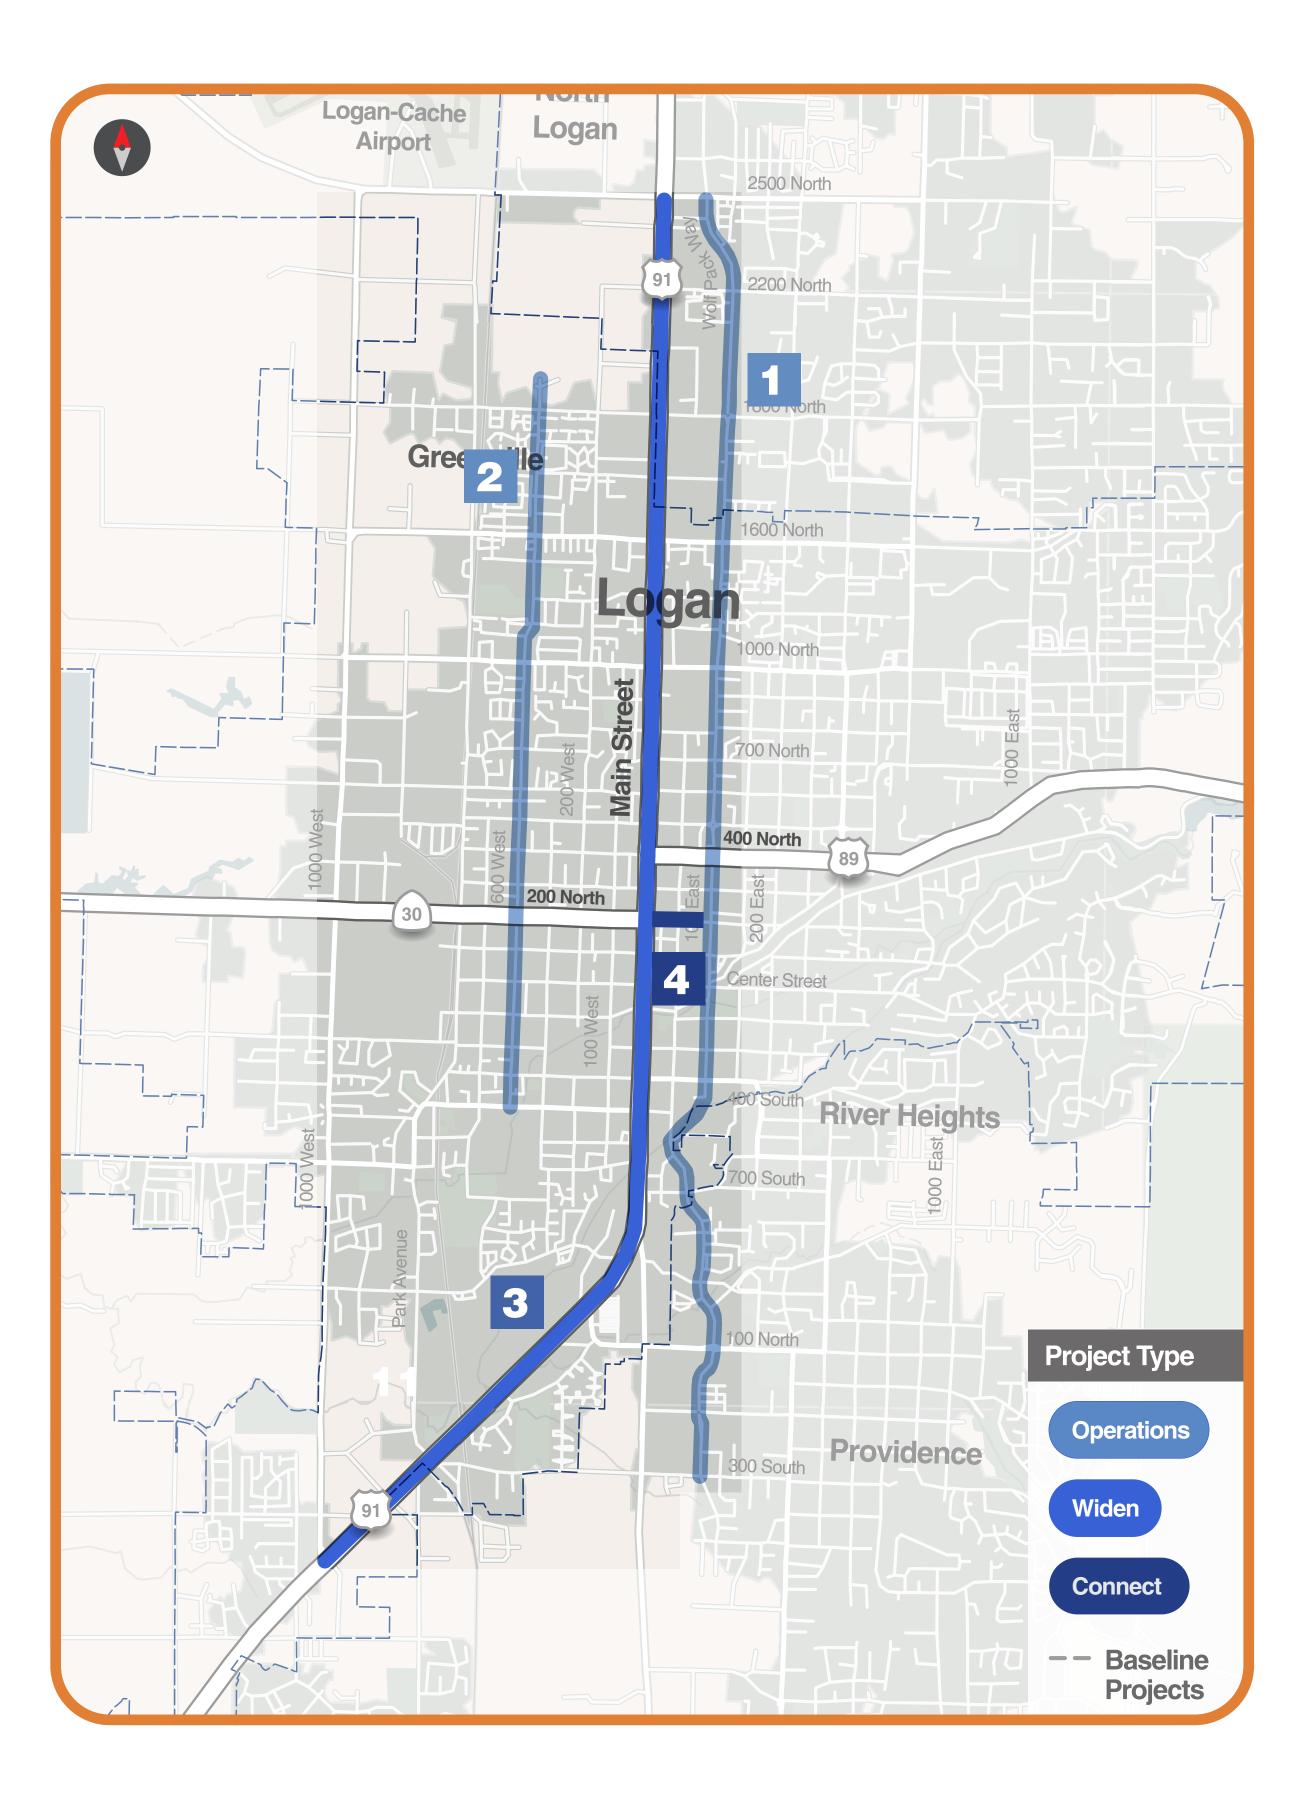

MAIN STREET FOCUS SCENARIO

The Main Street Focus Scenario prioritized north-south travel by proposing improvements to 200 East, 400 West, and Main Street.

- **200 East:** Operational improvements
- 400 West: Operational improvements
- Main Street: Widen to seven lanes 3
- 4 Y-X Concept: Connect Main Street and 100 East

PHASE 2 EVALUATION METRICS

The three new scenarios that came out of the first phase of evaluation were then analyzed based on these secondary metrics.

METRIC

Compatibility with regional multimodal plans

Quality of east-west pedestrian and bicycle crossings

Limiting and balancing neighborhood impacts

Systemwide travel time reduction

Change in PM peak travel time (mm:ss) on Main Street and parallel facilities

PHASE 2 SCENARIO **EVALUATION MATRIX**

		Scenario Name	Parallel Corridors	1000 West Focus	Main Street Focus
GOAL	METRIC	PHA	SE 2 EVALUAT	ΙΟΝ	
	Compatibility with regional multimodal plans	Potential conflict between parallel route designations for bike, pedestrian, or transit priorities vs. vehicular traffic.	Aligned with RTP and prior studies; interaction with 100 W buffered bike lanes, 600 E bike lanes	Partial alignment with	Not aligned with RTP; impacts on Main Street walkability
	Quality of east-west pedestrian and bike crossings	Responding to complaints and observations of Main Street being uncomfortable to cross.	Potential benefit to Main Street crossings	Potential benefit to Main Street crossings	Likely to further reduce Main Street crossing comfort
	Limiting and balancing neighborhood impacts	Measured in terms of total traffic volumes and balance of volumes on local/minor collector roads east and west of Main Street.	Traffic and property impacts on two east- and west-side corridors	Traffic and property impacts on one east-side corridor	Concentrated traffic and parking/ROW impacts on Main Street
	Systemwide travel time reduction	Measure of overall system functionality and additional mobility provided by new/enhanced facilities. Measured by VISUM model results.	300 hours of PM peak hour VHT reduced vs. future baseline	250 hours of PM peak hour VHT reduced vs. future baseline	225 hours of PM peak hour VHT reduced vs. future baseline
	Change in PM peak travel time (mm:ss) on Main Street and parallel facilities	Direct measure of whether Main Street and parallel corridor operations are improved by packages of solutions. Measured by VISUM model results.	Main Street: Average • -3:00 (NB) Off-Main: • -5:15 (SB) • -5:00 (NB) • -2:30 (SB)	Main Street: Average Off-Main: • -1:30 (NB) Off-Main: • -3:00 (SB) • -3:00 (NB) • -2:45 (SB)	Main Street: Average • -4:30 (NB) Off-Main: • -2:15 (SB) • -1:45 (NB) • -1:45 (SB)

GOAL DEFINITIONS

Improve mobility for all users

Improve activity centers and corridor-side safety

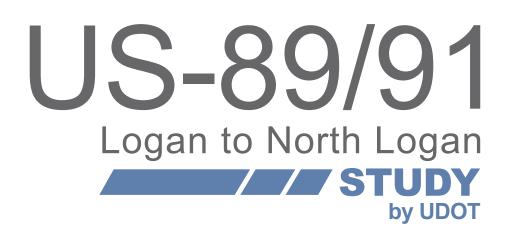

SCENARIO PERFORMANCE

The following table and graph further explain how well the scenarios do (or do not) perform against forecasted 2032 and 2050 conditions (based on anticipated regional growth and other planned near-term projects). Performance is evaluated in terms of reduced travel delay (minutes and seconds) for all trips in central Cache Valley.

SCENARIO COMPARISON: SYSTEM-LEVEL DELAY METRICS

RECOMMENDED SCENARIO DEVELOPMENT

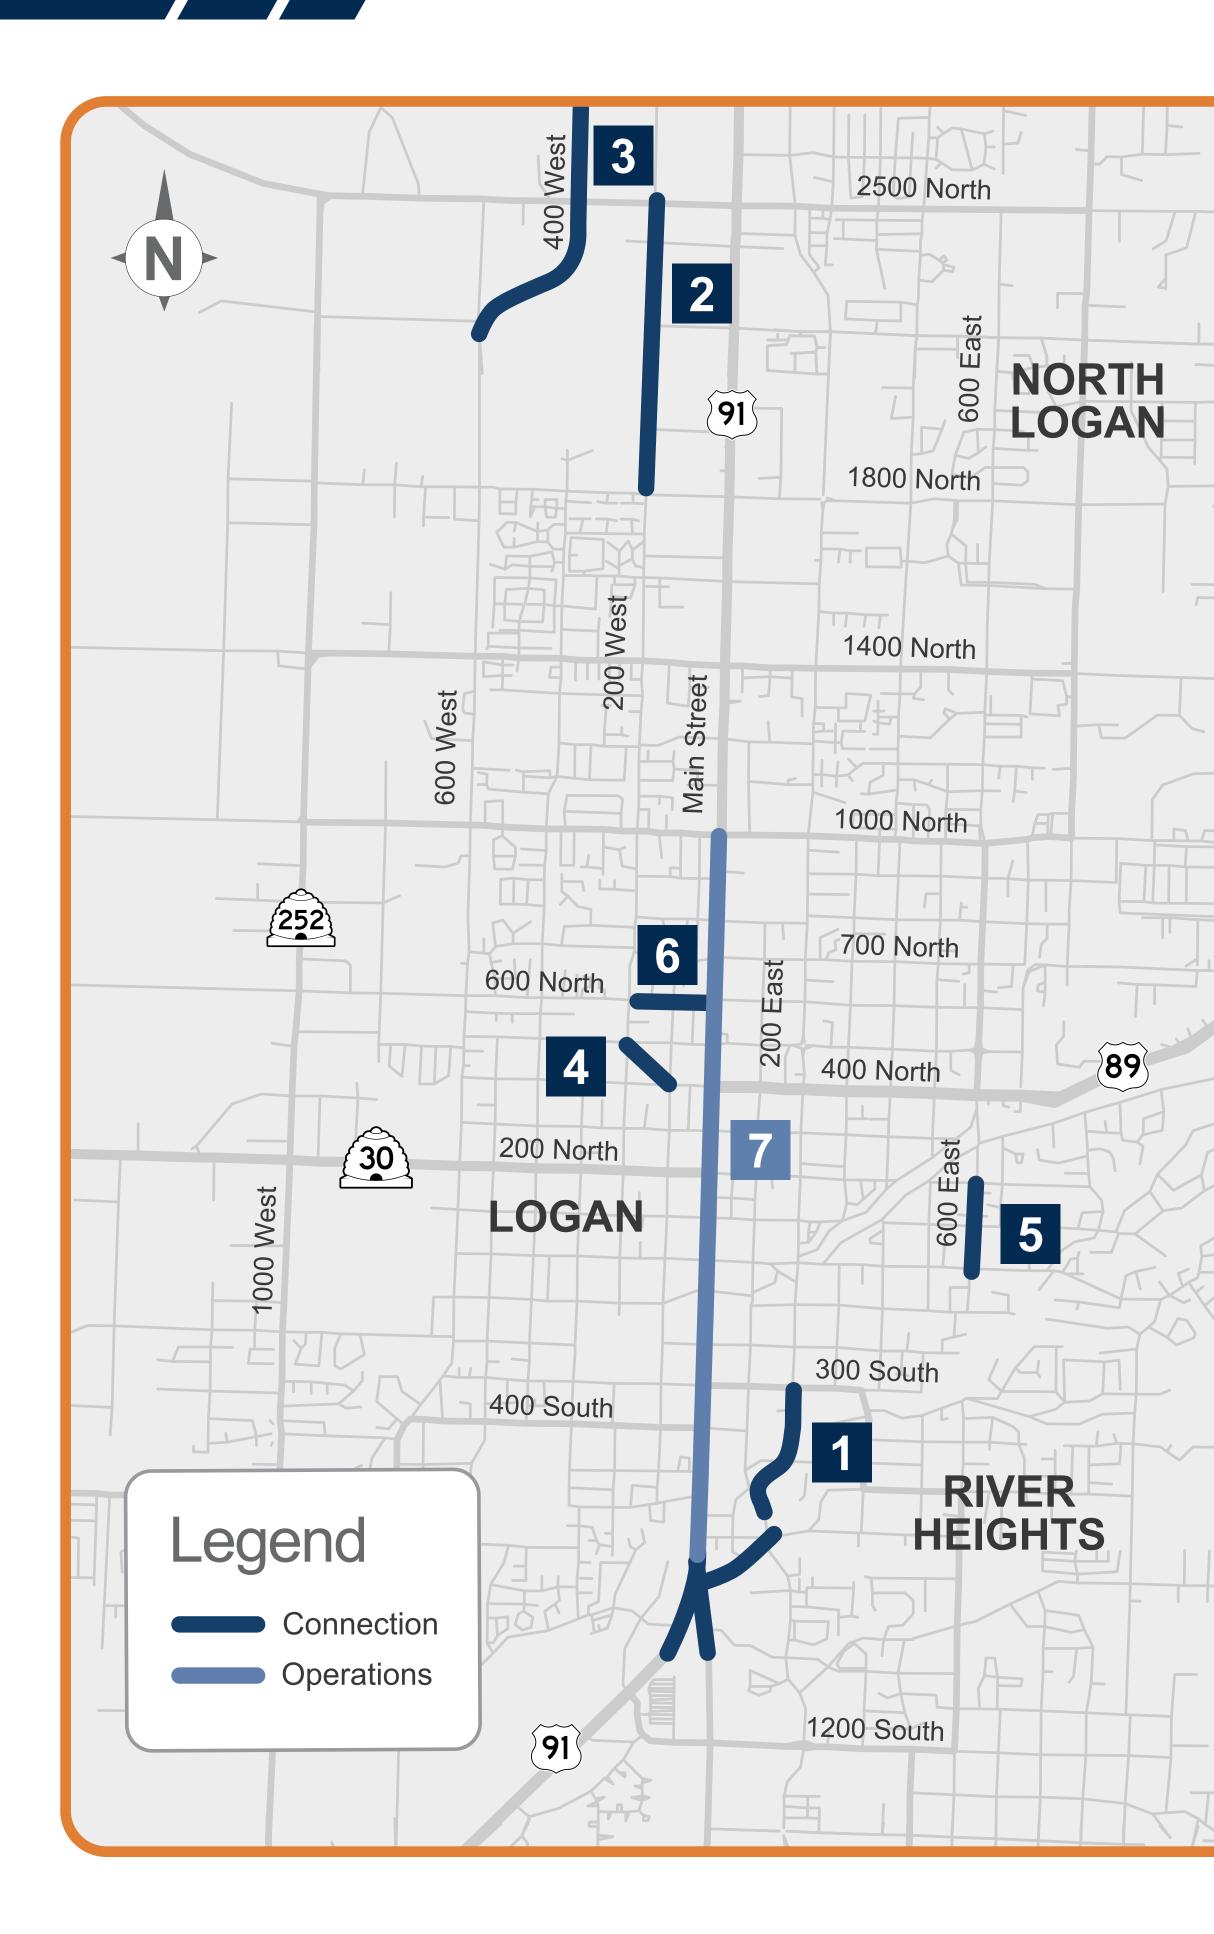

The Recommended Scenario combined the best performing projects from all scenarios studied over the past year to develop a group of key projects that prioritize mobility on and connections between north-south corridors, increase network redundancy, and enhance system resiliency.

US - 89/91Logan to North Logan by UDO1 RECOMMENDED SCENARIO SUMMARY US-91 and Main Street: Y-X Concept/100 East to

200 East Connection

3

4

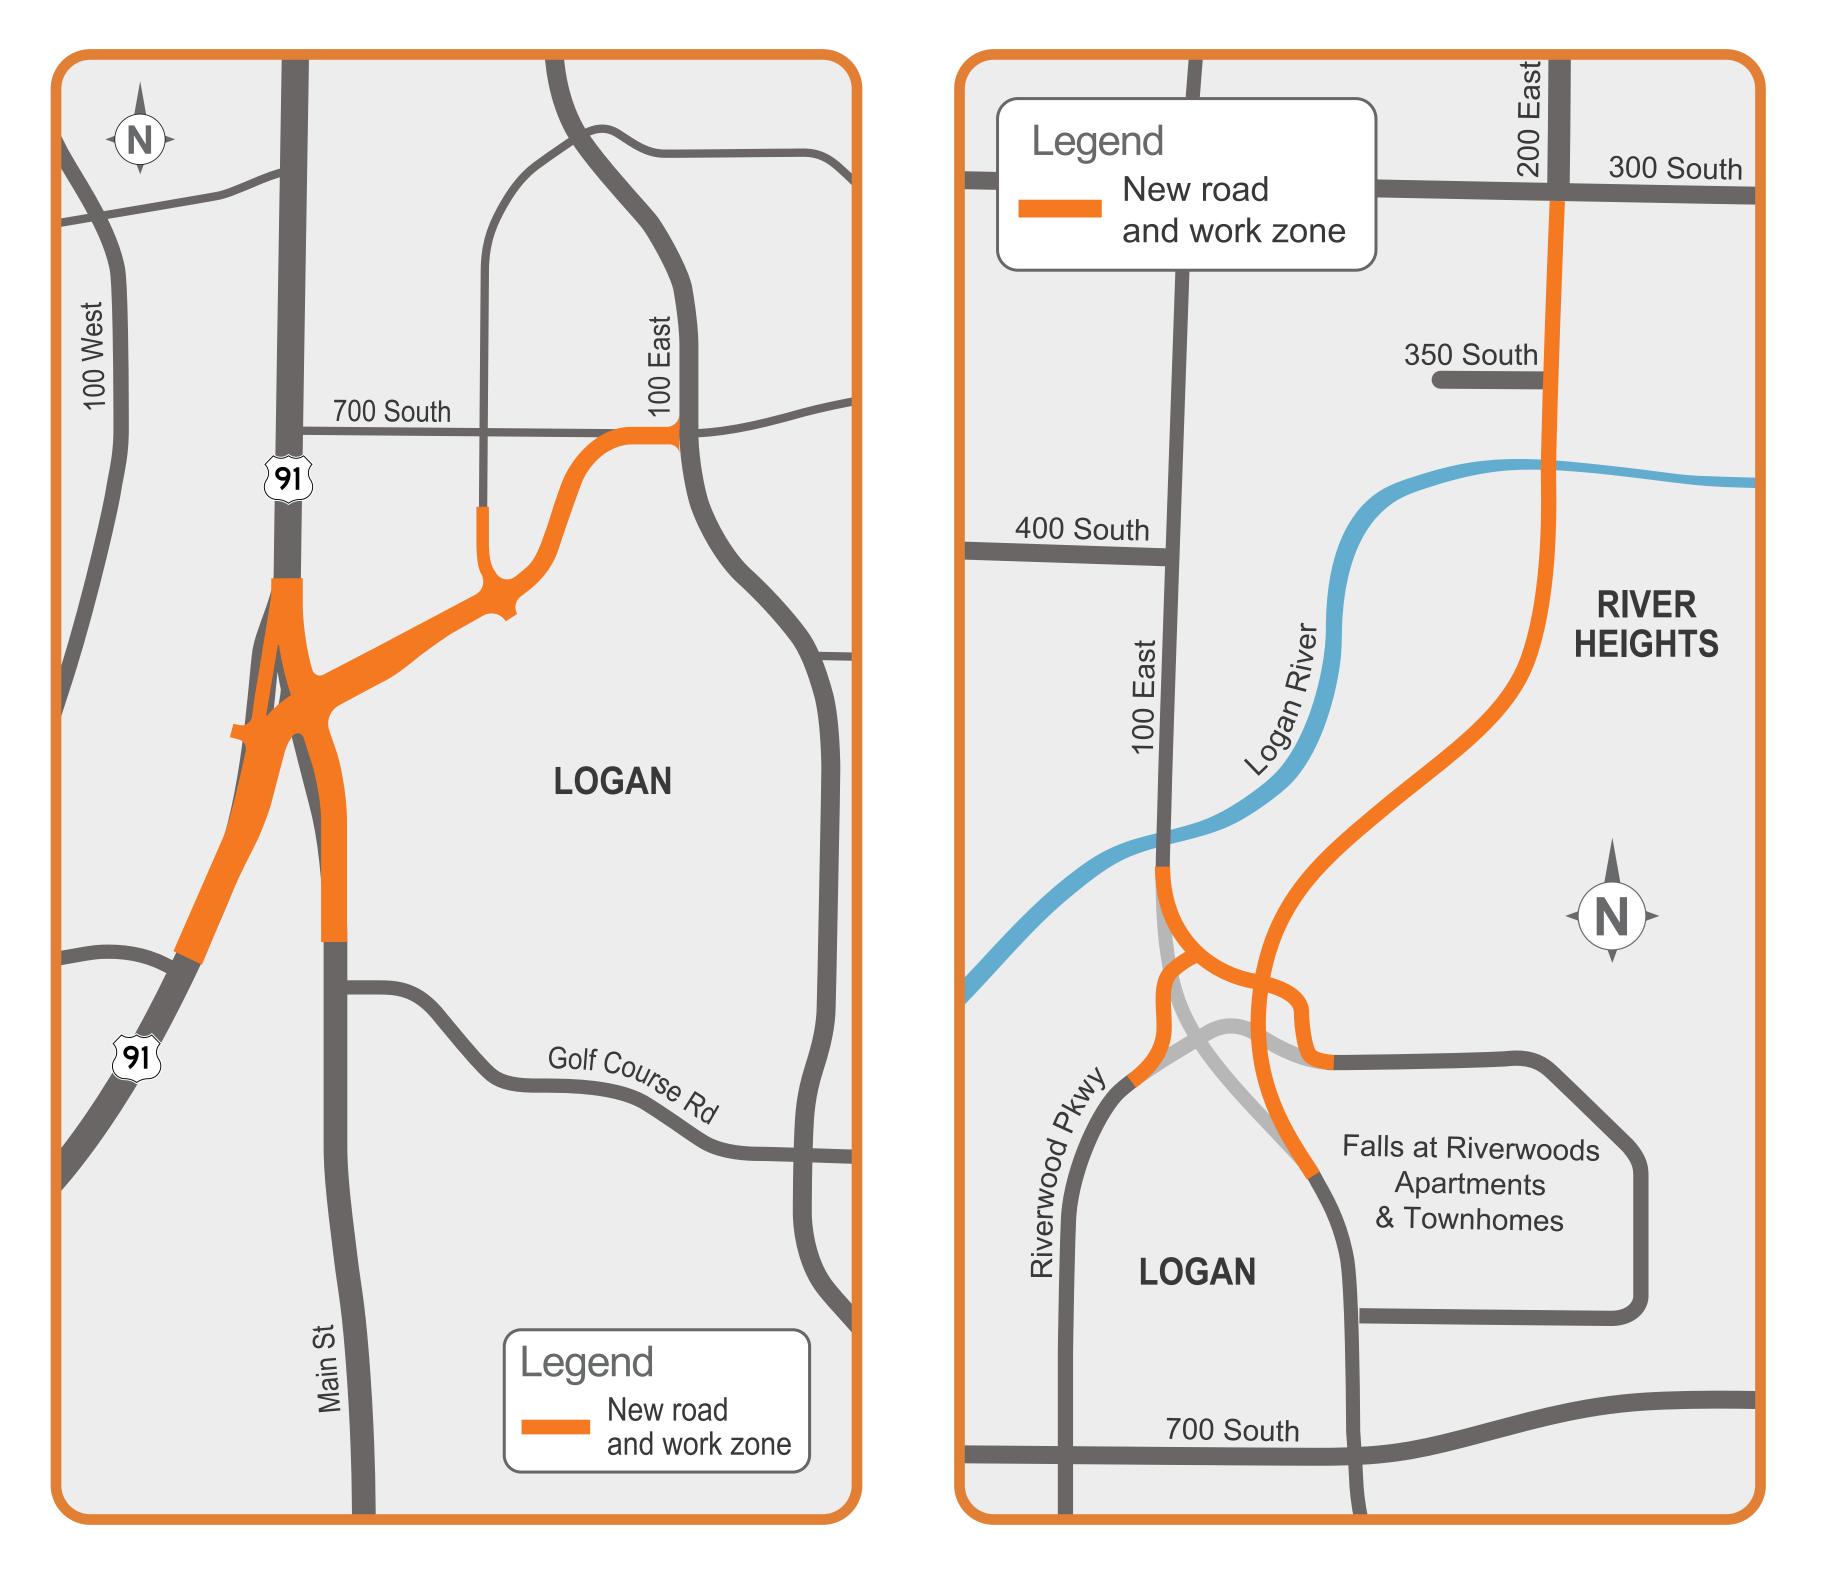

5

6

- 200 West Extension to 2500 North
- 600 West to 400 West Connection
- 100 West to 200 West Connection
- 600 East Connection: Center Street to 200 North
- 600 North Realignment at Main Street
- US-89/US-91; Logan Main Street 700 South to 1000 North

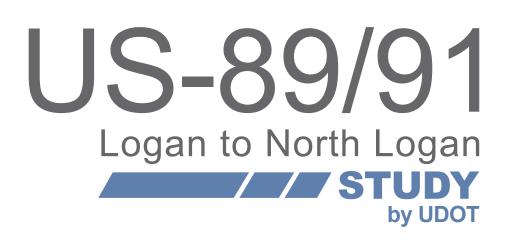

US-91 AND MAIN STREET: Y-X CONCEPT/ 100 EAST TO 200 EAST CONNECTION

SCENARIO 1

This proposed project would extend 200 East south and provide connections to 100 East between 700 South and 300 South. The extension of 200 East is proposed to have one lane in both directions, with a center turn lane.

This proposed project would construct an east-west connecting roadway between Main Street and 100 East in Logan. This connection would tie into the intersection of US-91 and Main Street on the west end and the intersection of 700 South and 100 East on the east end to create a more traditional X-intersection at this location. The new roadway is proposed to be two lanes in both directions, with turn lanes.

200 WEST EXTENSION **TO 2500 NORTH**

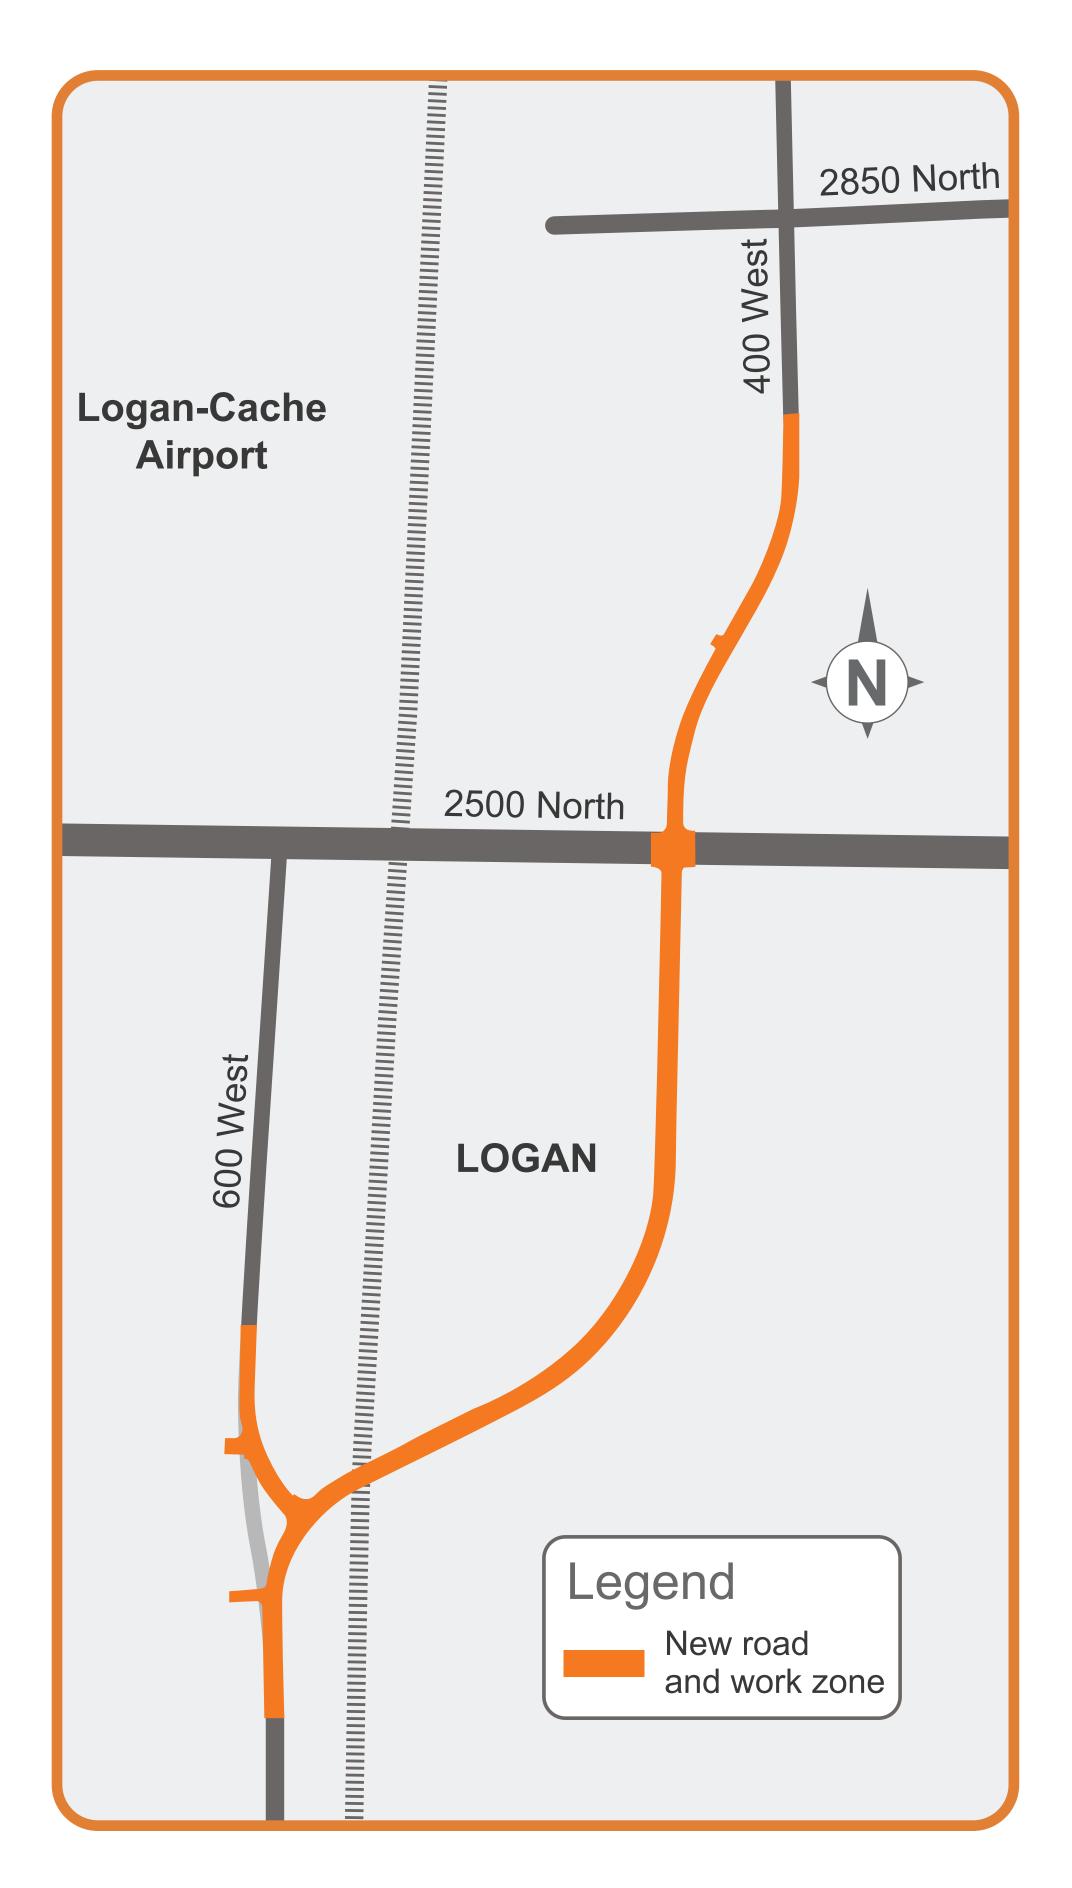

SCENARIO 2

This proposed project would connect 200 West in Logan from 1800 North to 2200 North and expand the roadway from 2200 North to 2500 North to one lane in both directions, with a center turn lane. Sidewalks would be constructed in residential areas.

600 WEST TO 400 WEST CONNECTION

SCENARIO 3

This proposed project would extend 600 West to 400 West in Logan between 2500 North and approximately 2850 North. This new connection would match the existing lane configuration with one lane in both direction.

100 WEST TO200 WEST CONNECTION

SCENARIO 4

This proposed project would construct multi-lane roundabouts on 500 North in Logan at the intersections of 100 West and 200 West. The project would also add an additional lane in both directions on the following streets:

- 200 West between 500 North and 600 North
- 100 West between 400 North and 500 North
- 500 North between 200 West and 100 West

600 EAST CONNECTION: CENTER STREET TO 200 NORTH

SCENARIO 5

This proposed project would construct a new segment of 600 East in Logan to connect Center Street to 200 North. The road would consist of one lane in both directions and would include curb, gutter, and sidewalk.

600 NORTH REALIGNMENT AT MAIN STREET

SCENARIO 6

This proposed project would realign approximately 500 feet of 600 North located west of Main Street in Logan to eliminate the offset between the current intersections to improve traffic flow.

US-89/US-91; LOGAN MAIN STREET 700 SOUTH TO 1000 NORTH

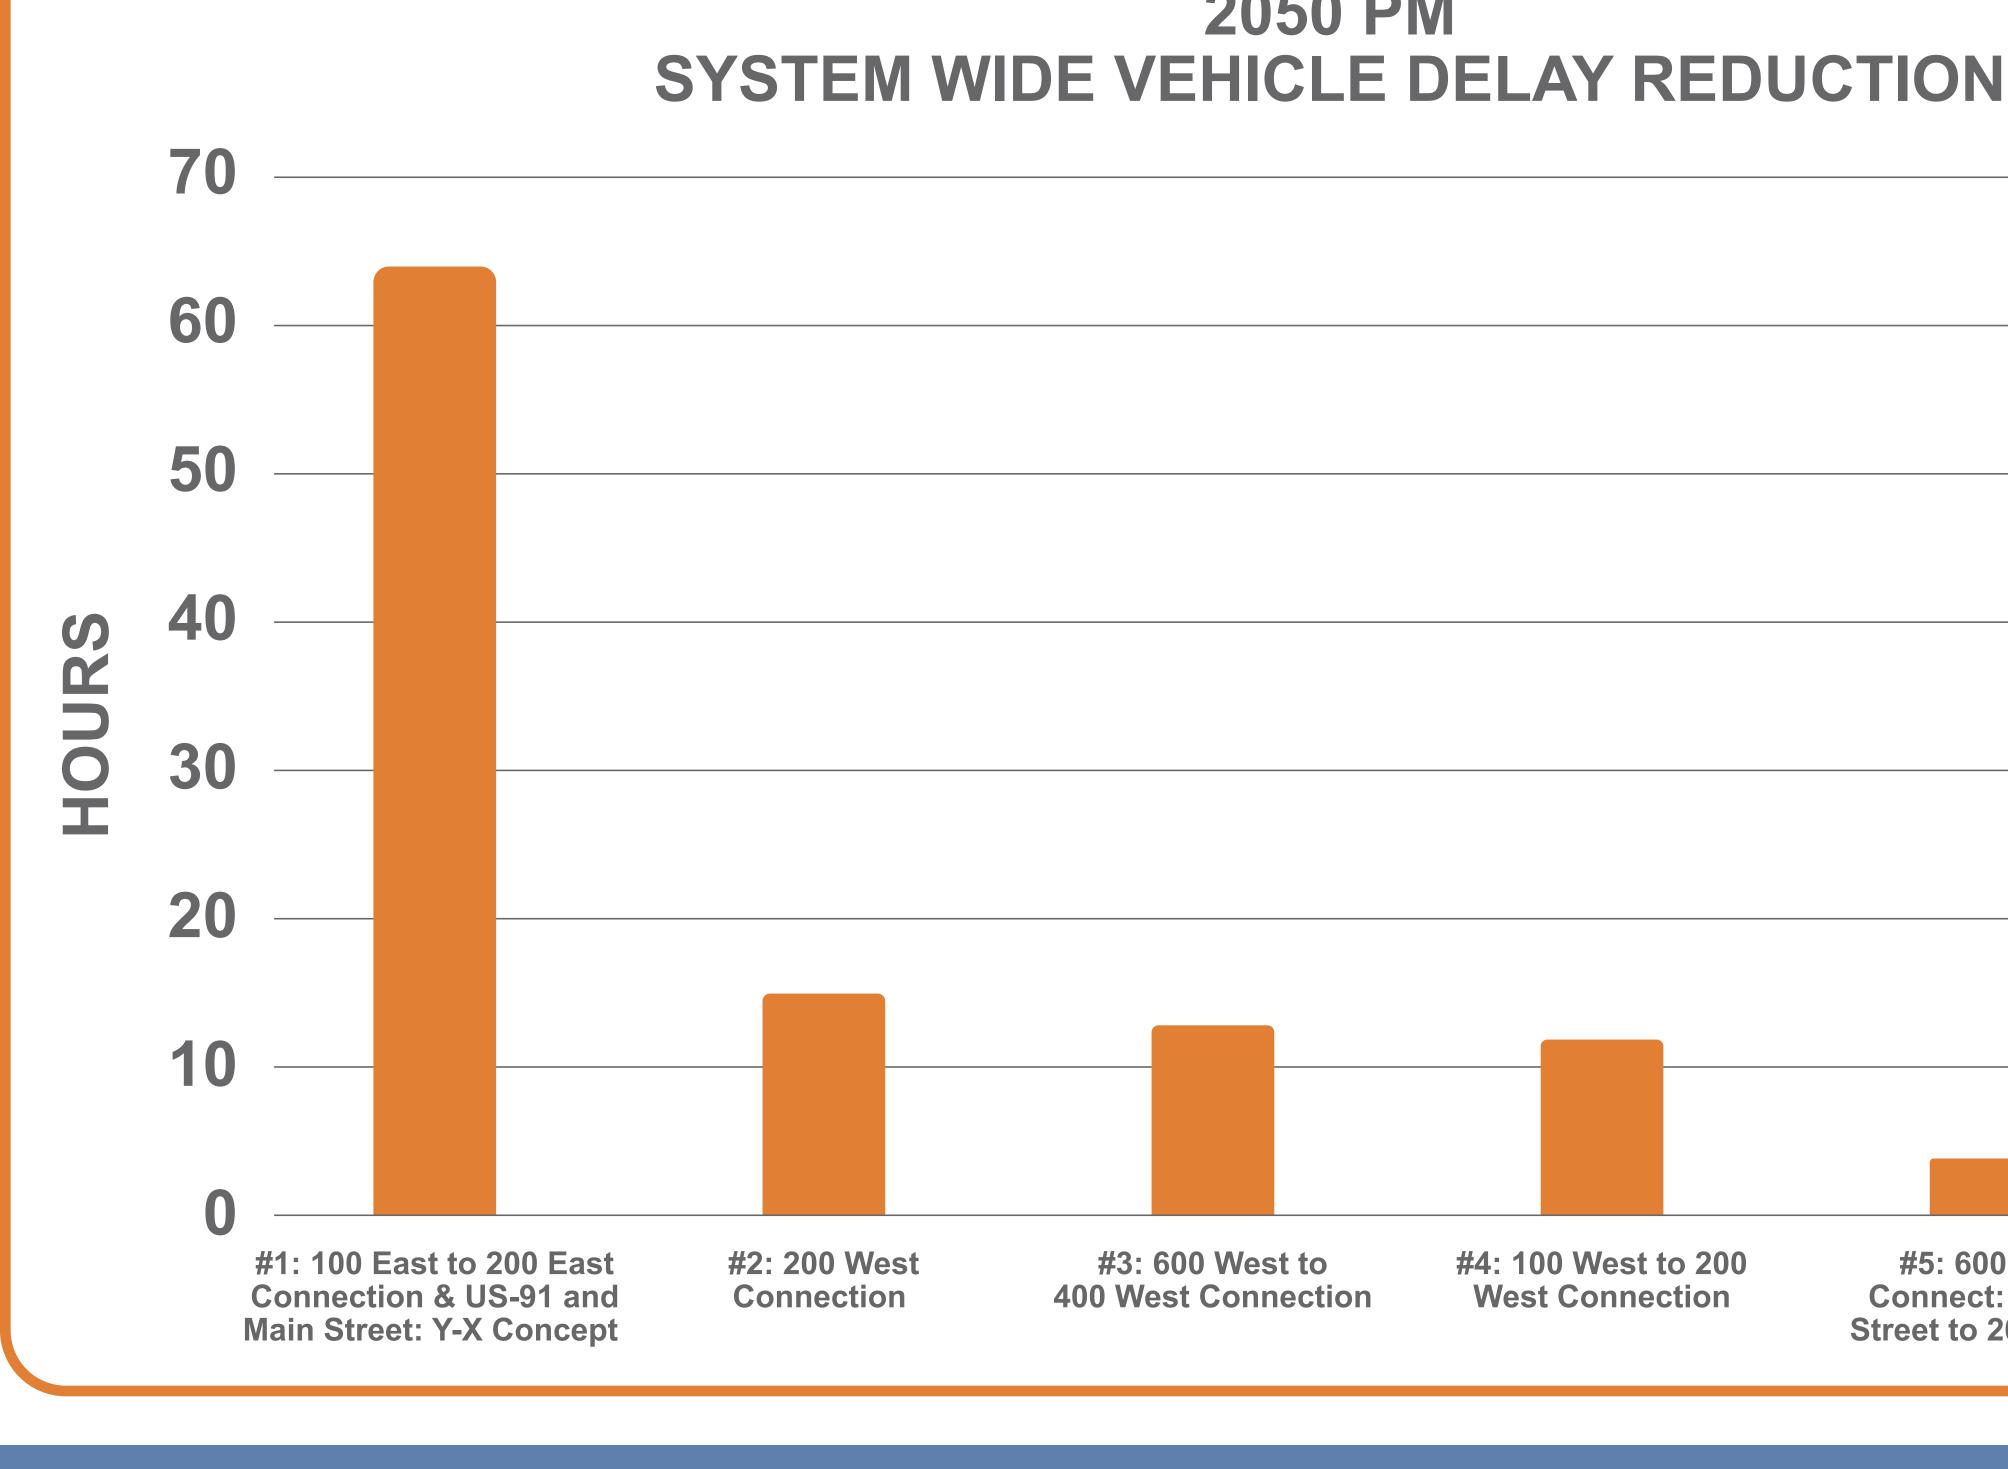

SCENARIO 7

This project will reconstruct and upgrade the existing roadway between 700 South and 1000 North to improve mobility for multiple modes of travel, including the modification of several intersections. Specific characteristics of roadway upgrades are yet to be determined.

RECOMMENDED SCENARIO PROJECT PERFORMANCE

2050 PM

) East : Center 200 North	#6: 600 North Realignment at Main St	

NEXT STEPS

UDOT will work closely with the Cache Valley Metropolitan Planning Organization and the local municipalities to update the long-range transportation plan for the area and determine ownership for each of the projects identified in the recommended scenario.
